

THE DIVAL[®] GUARDRAIL PARTITION*

The Dival partition, used with screwed Omega joint-covers, successfully passed the dynamic impact tests according to the norm P 08-302 (soft impacts 900J and hard impacts 10J).

This removable partition can be now used as a **guardrail partition**, in a full-height solid, glazed on dado panel, or even full-height glazed configuration up to 3,20 m high.

The Dival[®] partition is perfect for the projects with high requirements of stability and design, thanks to its flat (1,5 or 5 mm thickness), hollow or Omega joint-covers, allowing slot channels to receive either shelves or colored PVC trims.

* A guardrail system means a solution to protect people from falling down (from a 1m-height)
